The elephant in the room

The elephant in the room

Discrimated Union before GTA 6 is crazy

I've wanted unions forever in C#, but this seems very rough. The boxing and what's required to avoid that, the lack of labels etc. The lack of labels is a strange choice, forcing you to switch/match on types and limits its usefulness.

Why can't they use source generators to implement the IUnion interface for us and avoid boxing?

In my opinion they really need to deal with the boxing issue.

Waited so long only to get boxxed!

Boxing is a bummer

The boxing by default is disappointing. I imagine they took so long because they were trying hard to implement it in a non boxing way.
